## Common Vulnerabilities and Exposures (CVE) Report

Weakness	Publish Date	CVSSv3	Description & CVE ID	Patch	NCIIPC ID
<b>Application</b>					
<b>Vendor: 10web</b>					
<b>Product: form_maker</b>					
Affected Version(s): * Up to (excluding) 1.15.6					
Improper Neutralization of Special Elements used in an SQL Command ('SQL Injection')	25-Oct-2022	7.2	The Form Maker by 10Web WordPress plugin before 1.15.6 does not properly sanitise and escape a parameter before using it in a SQL statement, leading to a SQL injection exploitable by high privilege users such as admin  <b>CVE ID : CVE-2022-3300</b>	<a href="https://wpscan.com/vulnerability/dc9ed69-d942-4fad-bbf4-1be3b86460d9">https://wpscan.com/vulnerability/dc9ed69-d942-4fad-bbf4-1be3b86460d9</a>	A-10W-FORM-041122/1
<b>Vendor: 74cms</b>					
<b>Product: 74cmsse</b>					
Affected Version(s): 3.12.0					
Incorrect Permission Assignment for Critical Resource	17-Oct-2022	6.5	74cmsSE v3.12.0 allows authenticated attackers with low-level privileges to arbitrarily change the rights and credentials of the Super Administrator account.  <b>CVE ID : CVE-2022-41471</b>	N/A	A-74C-74CM-041122/2
Improper Neutralization of Input During Web Page Generation ('Cross-site	17-Oct-2022	5.4	74cmsSE v3.12.0 was discovered to contain a cross-site scripting (XSS) vulnerability via the component /apiadmin/notice/add. This vulnerability allows attackers to execute arbitrary web scripts or HTML via a crafted	N/A	A-74C-74CM-041122/3

			interpreting URIs. We recommend updating Dart or Flutter to mitigate the issue. <b>CVE ID : CVE-2022-3095</b>		
<b>Vendor: dataease</b>					
<b>Product: dataease</b>					
Affected Version(s): * Up to (excluding) 1.15.2					
Deserializ ation of Untrusted Data	25-Oct-2022	9.8	Dataease is an open source data visualization analysis tool. Dataease prior to 1.15.2 has a deserialization vulnerability. In Dataease, the Mysql data source in the data source function can customize the JDBC connection parameters and the Mysql server target to be connected. In `backend/src/main/java/io/dataease/provider/datasource/JdbcProvider.java`, the `MysqlConfiguration` class does not filter any parameters. If an attacker adds some parameters to a JDBC url and connects to a malicious mysql server, the attacker can trigger the mysql jdbc deserialization vulnerability. Through the deserialization vulnerability, the attacker can execute system commands and obtain server privileges.	<a href="https://github.com/dataease/dataease/commit/956ee2d6c9e81349a60aef435efc046888e10a6d">https://github.com/dataease/dataease/commit/956ee2d6c9e81349a60aef435efc046888e10a6d</a> , <a href="https://github.com/dataease/dataease/pull/3328">https://github.com/dataease/dataease/pull/3328</a> , <a href="https://github.com/dataease/dataease/security/advisories/GHSA-q4qq-jhvj-7rh2">https://github.com/dataease/dataease/security/advisories/GHSA-q4qq-jhvj-7rh2</a>	A-DAT-DATA-041122/839

			Version 1.15.2 contains a patch for this issue. <b>CVE ID : CVE-2022-39312</b>		
<b>Vendor: datahub_project</b>					
<b>Product: datahub</b>					
Affected Version(s): * Up to (excluding) 0.8.45					
Improper Verification of Cryptographic Signature	28-Oct-2022	9.8	DataHub is an open-source metadata platform. Prior to version 0.8.45, the `StatelessTokenService` of the DataHub metadata service (GMS) does not verify the signature of JWT tokens. This allows an attacker to connect to DataHub instances as any user if Metadata Service authentication is enabled. This vulnerability occurs because the `StatelessTokenService` of the Metadata service uses the `parse` method of `io.jsonwebtoken.JwtParser`, which does not perform a verification of the cryptographic token signature. This means that JWTs are accepted regardless of the used algorithm. This issue may lead to an authentication bypass. Version 0.8.45 contains a patch for the issue. There are no known workarounds.	<a href="https://github.com/datahub-project/datahub/security/advisories/GHSA-r8gm-v65f-c973">https://github.com/datahub-project/datahub/security/advisories/GHSA-r8gm-v65f-c973</a>	A-DAT-DATA-041122/840

Implementation			<p>use the `is_static` parameter to determine if the call is executed in a static context (via `STATICCALL`), and thus decide if stateful operations should be done. Prior to version 0.36.0, the passed `is_static` parameter was incorrect -- it was only set to `true` if the call came from a direct `STATICCALL` opcode. However, once a static call context is entered, it should stay static. The issue only impacts custom precompiles that actually uses `is_static`. For those affected, the issue can lead to possible incorrect state transitions. Version 0.36.0 contains a patch. There are no known workarounds.</p> <p><b>CVE ID : CVE-2022-39354</b></p>	<a href="https://github.com/rust-blockchain/evm/security/advisories/GHSA-hhc4-47rh-cr34">https://github.com/rust-blockchain/evm/security/advisories/GHSA-hhc4-47rh-cr34</a>

Missing Release of Memory after Effective Lifetime	21-Oct-2022	7.5	A vulnerability was found in Nginx and classified as problematic. This issue affects some unknown processing of the file ngx_resolver.c of the component IPv4 Off Handler. The manipulation leads to memory leak. The attack may be initiated remotely. It is recommended to apply a patch to fix this issue. The identifier VDB-211937 was assigned to this vulnerability. <b>CVE ID : CVE-2022-3638</b>	<a href="http://hg.nginx.org/nginx/rev/0422365794f7">http://hg.nginx.org/nginx/rev/0422365794f7</a> , <a href="https://github.com/nginx/nginx/commit/14341ce2377d38a268261e0fec65b6915ae6e95e">https://github.com/nginx/nginx/commit/14341ce2377d38a268261e0fec65b6915ae6e95e</a>	A-F5-NGIN-041122/1279

			have rewritten the affected code so that the delay is also inserted after the brute force limit is reached. <b>CVE ID : CVE-2022-39315</b>		
Improper Restriction of Excessive Authentication Attempts	24-Oct-2022	3.7	Kirby is a flat-file CMS. In versions prior to 3.5.8.2, 3.6.6.2, 3.7.5.1, and 3.8.1, Kirby is subject to user enumeration due to Improper Restriction of Excessive Authentication Attempts. This vulnerability affects you only if you are using the `code` or `password-reset` auth method with the `auth.methods` option or if you have enabled the `debug` option in production. By using two or more IP addresses and multiple login attempts, valid user accounts will lock, but invalid accounts will not, leading to account enumeration. This issue has been patched in versions 3.5.8.2, 3.6.6.2, 3.7.5.1, and 3.8.1. If you cannot update immediately, you can work around the issue by setting the `auth.methods` option to `password`, which disables the code-based login and password reset forms.	<a href="https://github.com/getkirby/kirby/security/advisories/GHSA-43qq-qw4x-28f8">https://github.com/getkirby/kirby/security/advisories/GHSA-43qq-qw4x-28f8</a>	A-GET-KIRB-041122/1367

			this issue. There are no workarounds aside from upgrading to a patched version. <b>CVE ID : CVE-2022-39345</b>	ed-aurora/gin-vue-admin/pull/1264	
Affected Version(s): * Up to (excluding) 2.5.4b					
Unrestricted Upload of File with Dangerous Type	24-Oct-2022	9.8	Gin-vue-admin is a backstage management system based on vue and gin, which separates the front and rear of the full stack. Versions prior to 2.5.4 contain a file upload ability. The affected code fails to validate fileMd5 and fileName parameters, resulting in an arbitrary file being read. This issue is patched in 2.5.4b. There are no known workarounds. <b>CVE ID : CVE-2022-39305</b>	<a href="https://github.com/flipped-aurora/gin-vue-admin/security/advisories/GHSA-wrmq-4v4c-gxp2">https://github.com/flipped-aurora/gin-vue-admin/security/advisories/GHSA-wrmq-4v4c-gxp2</a>	A-GIN-GIN--041122/1375
Affected Version(s): From (including) 2.5.1 Up to (including) 2.5.3b					
Unrestricted Upload of File with Dangerous Type	17-Oct-2022	9	In "Gin-Vue-Admin", versions v2.5.1 through v2.5.3b are vulnerable to Unrestricted File Upload that leads to execution of javascript code, through the "Compress Upload" functionality to the Media Library. When an admin user views the uploaded file, a low privilege attacker will get access to the admin's cookie leading to account takeover.	N/A	A-GIN-GIN--041122/1376

			<b>CVE ID : CVE-2022-32176</b>		
<b>Vendor: Git-scm</b>					
<b>Product: git</b>					
Affected Version(s): * Up to (excluding) 2.30.6					
Out-of-bounds Write	19-Oct-2022	8.8	Git is an open source, scalable, distributed revision control system. `git shell` is a restricted login shell that can be used to implement Git's push/pull functionality via SSH. In versions prior to 2.30.6, 2.31.5, 2.32.4, 2.33.5, 2.34.5, 2.35.5, 2.36.3, and 2.37.4, the function that splits the command arguments into an array improperly uses an `int` to represent the number of entries in the array, allowing a malicious actor to intentionally overflow the return value, leading to arbitrary heap writes. Because the resulting array is then passed to `execv()`, it is possible to leverage this attack to gain remote code execution on a victim machine. Note that a victim must first allow access to `git shell` as a login shell in order to be vulnerable to this attack. This problem is patched in versions 2.30.6, 2.31.5, 2.32.4, 2.33.5, 2.34.5, 2.35.5, 2.36.3, and 2.37.4 and users are advised to upgrade to the latest	<a href="https://github.com/git/git/security/advisories/GHSA-rjr6-wcq6-83p6">https://github.com/git/git/security/advisories/GHSA-rjr6-wcq6-83p6</a>	A-GIT-GIT-041122/1377

			version. Disabling `git shell` access via remote logins is a viable short-term workaround. <b>CVE ID : CVE-2022-39260</b>		
Improper Link Resolution Before File Access ('Link Following')	19-Oct-2022	5.5	Git is an open source, scalable, distributed revision control system. Versions prior to 2.30.6, 2.31.5, 2.32.4, 2.33.5, 2.34.5, 2.35.5, 2.36.3, and 2.37.4 are subject to exposure of sensitive information to a malicious actor. When performing a local clone (where the source and target of the clone are on the same volume), Git copies the contents of the source's `\$GIT_DIR/objects` directory into the destination by either creating hardlinks to the source contents, or copying them (if hardlinks are disabled via `--no-hardlinks`). A malicious actor could convince a victim to clone a repository with a symbolic link pointing at sensitive information on the victim's machine. This can be done either by having the victim clone a malicious repository on the same machine, or having them clone a malicious repository embedded as	<a href="https://github.com/git/git/security/advisories/GHSA-3wp6-j8xr-qw85">https://github.com/git/git/security/advisories/GHSA-3wp6-j8xr-qw85</a>	A-GIT-GIT-041122/1378

			<p>push/pull functionality via SSH. In versions prior to 2.30.6, 2.31.5, 2.32.4, 2.33.5, 2.34.5, 2.35.5, 2.36.3, and 2.37.4, the function that splits the command arguments into an array improperly uses an `int` to represent the number of entries in the array, allowing a malicious actor to intentionally overflow the return value, leading to arbitrary heap writes. Because the resulting array is then passed to `execv()`, it is possible to leverage this attack to gain remote code execution on a victim machine. Note that a victim must first allow access to `git shell` as a login shell in order to be vulnerable to this attack. This problem is patched in versions 2.30.6, 2.31.5, 2.32.4, 2.33.5, 2.34.5, 2.35.5, 2.36.3, and 2.37.4 and users are advised to upgrade to the latest version. Disabling `git shell` access via remote logins is a viable short-term workaround.</p> <p><b>CVE ID : CVE-2022-39260</b></p>		
Improper Link Resolution Before File	19-Oct-2022	5.5	<p>Git is an open source, scalable, distributed revision control system. Weakness	Publish Date	CVSSv3	Description & CVE ID	Patch	NCIIPC ID
Access ('Link Following')			2.34.5, 2.35.5, 2.36.3, and 2.37.4 are subject to exposure of sensitive information to a malicious actor. When performing a local clone (where the source and target of the clone are on the same volume), Git copies the contents of the source's '\$GIT_DIR/objects' directory into the destination by either creating hardlinks to the source contents, or copying them (if hardlinks are disabled via '--no-hardlinks'). A malicious actor could convince a victim to clone a repository with a symbolic link pointing at sensitive information on the victim's machine. This can be done either by having the victim clone a malicious repository on the same machine, or having them clone a malicious repository embedded as a bare repository via a submodule from any source, provided they clone with the '--recurse-submodules' option. Git does not create symbolic links in the '\$GIT_DIR/objects' directory. The problem has been patched in the versions published on 2022-10-18, and	HSA-3wp6-j8xr-qw85

Weakness	Publish Date	CVSSv3	Description & CVE ID	Patch	NCIIPC ID
Affected Version(s): From (including) 7.77.0 Up to (excluding) 7.86.0					
N/A	29-Oct-2022	0	<p>curl before 7.86.0 has a double free. If curl is told to use an HTTP proxy for a transfer with a non-HTTP(S) URL, it sets up the connection to the remote server by issuing a CONNECT request to the proxy, and then tunnels the rest of the protocol through. An HTTP proxy might refuse this request (HTTP proxies often only allow outgoing connections to specific port numbers, like 443 for HTTPS) and instead return a non-200 status code to the client. Due to flaws in the error/cleanup handling, this could trigger a double free in curl if one of the following schemes were used in the URL for the transfer: dict, gopher, gophers, ldap, ldaps, rtmp, rtmps, or telnet. The earliest affected version is 7.77.0.</p> <p><b>CVE ID : CVE-2022-42915</b></p>	N/A	A-HAX-CURL-041122/1504

<b>Vendor: Microsoft</b>					
<b>Product: azure_command-line_interface</b>					
Affected Version(s): * Up to (excluding) 2.40.0					
Improper Control of Generation of Code ('Code Injection')	25-Oct-2022	9.8	<p>Azure CLI is the command-line interface for Microsoft Azure. In versions previous to 2.40.0, Azure CLI contains a vulnerability for potential code injection. Critical scenarios are where a hosting machine runs an Azure CLI command where parameter values have been provided by an external source. The vulnerability is only applicable when the Azure CLI command is run on a Windows machine and with any version of PowerShell and when the parameter value contains the `&amp;` or ` ` symbols. If any of these prerequisites are not met, this vulnerability is not applicable. Users should upgrade to version 2.40.0 or greater to receive a mitigation for the vulnerability.</p> <p><b>CVE ID : CVE-2022-39327</b></p>	<p><a href="https://github.com/Azure/azure-cli/security/advisories/GHSA-47xc-9rr2-q7p4">https://github.com/Azure/azure-cli/security/advisories/GHSA-47xc-9rr2-q7p4</a>,  <a href="https://github.com/Azure/azure-cli/pull/23514">https://github.com/Azure/azure-cli/pull/23514</a>,  <a href="https://github.com/Azure/azure-cli/pull/24015">https://github.com/Azure/azure-cli/pull/24015</a></p>	A-MIC-AZUR-051122/1675

			<p>Security). Supported versions that are affected are Oracle Java SE: 8u341, 8u345-perf, 11.0.16.1; Oracle GraalVM Enterprise Edition: 20.3.7, 21.3.3 and 22.2.0. Easily exploitable vulnerability allows unauthenticated attacker with network access via HTTPS to compromise Oracle Java SE, Oracle GraalVM Enterprise Edition. Successful attacks of this vulnerability can result in unauthorized ability to cause a partial denial of service (partial DOS) of Oracle Java SE, Oracle GraalVM Enterprise Edition. Note: This vulnerability applies to Java deployments, typically in clients running sandboxed Java Web Start applications or sandboxed Java applets, that load and run untrusted code (e.g., code that comes from the internet) and rely on the Java sandbox for security. This vulnerability can also be exploited by using APIs in the specified Component, e.g., through a web service which supplies data to the APIs. CVSS 3.1 Base Score 5.3 (Availability impacts). 			<p>17.0.4.1, 19; Oracle GraalVM Enterprise Edition: 21.3.3 and 22.2.0. Easily exploitable vulnerability allows unauthenticated attacker with network access via Kerberos to compromise Oracle Java SE, Oracle GraalVM Enterprise Edition. Successful attacks of this vulnerability can result in unauthorized update, insert or delete access to some of Oracle Java SE, Oracle GraalVM Enterprise Edition accessible data. Note: This vulnerability applies to Java deployments, typically in clients running sandboxed Java Web Start applications or sandboxed Java applets, that load and run untrusted code (e.g., code that comes from the internet) and rely on the Java sandbox for security. This vulnerability can also be exploited by using APIs in the specified Component, e.g., through a web service which supplies data to the APIs. CVSS 3.1 Base Score 5.3 (Integrity impacts). 			<p>any XSS countermeasures built in, and versions before 4.6.1 of the Dependency-Track frontend did not encode or sanitize Showdown's output. This made it possible for arbitrary JavaScript included in vulnerability details via HTML attributes to be executed in context of the frontend. Actors with the `VULNERABILITY_MANAGEMENT` permission can exploit this weakness by creating or editing a custom vulnerability and providing XSS payloads in any of the following fields: Description, Details, Recommendation, or References. The payload will be executed for users with the `VIEW_PORTFOLIO` permission when browsing to the modified vulnerability's page. Alternatively, malicious JavaScript could be introduced via any of the vulnerability databases mirrored by Dependency-Track. However, this attack vector is highly unlikely, and the maintainers of Dependency-Track are not aware of any occurrence of this happening. Note that the</p>

#### Vendor: tasks

#### Product: tasks

Affected Version(s): \* Up to (excluding) 12.7.1

Exposure of Resource to Wrong Sphere	25-Oct-2022	5.5	The Tasks.org Android app is an open-source app for to-do lists and reminders. The Tasks.org app uses the activity `ShareLinkActivity.kt` to handle "share" intents coming from other components in the same device and convert them to tasks. Those intents may contain arbitrary file paths as attachments, in which case the files pointed by those paths are copied in the app's external storage directory. Prior to versions 12.7.1 and	<a href="https://github.com/tasks/security/advisories/GHSA-8x58-cg74-8jg8">https://github.com/tasks/security/advisories/GHSA-8x58-cg74-8jg8</a> , <a href="https://github.com/tasks/commit/23bf69d3f44b07e4bc62ea107f72103239f5d942">https://github.com/tasks/commit/23bf69d3f44b07e4bc62ea107f72103239f5d942</a>	A-TAS-TASK-051122/2038

Weakness	Publish Date	CVSSv3	Description & CVE ID	Patch	NCIIPC ID
			<p>Versions prior to 2022-07-12/Chart 4.19.0 are subject to Token Recipient Confusion. If an attacker has certain details of SAML IdP metadata, and configures their own SAML on the same backend, the attacker can delete all SAML authenticated accounts of a targeted team, Authenticate as a user of the attacked team and create arbitrary accounts in the context of the team if it is not managed by SCIM. This issue is fixed in wire-server 2022-07-12 and is already deployed on all Wire managed services. On-premise instances of wire-server need to be updated to 2022-07-12/Chart 4.19.0, so that their backends are no longer affected. As a workaround, the risk of an attack can be reduced by disabling SAML configuration for teams (galley.config.settings.featureFlags.sso). Helm overrides are located in `values/wire-server/values.yaml` Note that the ability to configure SAML SSO as a team is disabled by default for on-premise installations.</p>	server/security/advisories/GHSA-gg27-gmgq-fmxw

Out-of-bounds Write	19-Oct-2022	9.8	Acer Altos W2000h-W570h F4 R01.03.0018 was discovered to contain a stack overflow in the ReverseMem component. This vulnerability allows attackers to cause a Denial of Service (DoS) via injecting crafted shellcode into the NVRAM variable. <b>CVE ID : CVE-2022-41415</b>	<a href="http://acer.com">http://acer.com</a>	H-ACE-ALTO-071122/2085
<b>Vendor: Asus</b>					
<b>Product: rt-n12e</b>					
Affected Version(s): -					
Missing Authentication for Critical Function	19-Oct-2022	7.5	Asus RT-N12E 2.0.0.39 is affected by an incorrect access control vulnerability. Through system.asp / start_apply.htm, an attacker can change the administrator password without any authentication. <b>CVE ID : CVE-2020-23648</b>	<a href="https://www.asus.com/Networking/RTN12E/HelpDesk_BIOS/">https://www.asus.com/Networking/RTN12E/HelpDesk_BIOS/</a>	H-ASU-RT-N-071122/2086

			<p>supplied parameters while establishing an SSL VPN session. An attacker could exploit this vulnerability by crafting a malicious request and sending it to the affected device. A successful exploit could allow the attacker to cause the Cisco AnyConnect VPN server to crash and restart, resulting in the failure of the established SSL VPN connections and forcing remote users to initiate a new VPN connection and re-authenticate. A sustained attack could prevent new SSL VPN connections from being established. Note: When the attack traffic stops, the Cisco AnyConnect VPN server recovers gracefully without requiring manual intervention. Cisco Meraki has released software updates that address this vulnerability.</p> <p><b>CVE ID : CVE-2022-20933</b></p>

Affected Version(s): -					
N/A	18-Oct-2022	5.5	<p>An Improper Preservation of Consistency Between Independent Representations of Shared State vulnerability in the Packet Forwarding Engine (PFE) of Juniper Networks Junos OS allows a locally authenticated attacker with low privileges to cause a Denial of Service (DoS). If the device is very busy for example while executing a series of show commands on the CLI one or more SFPs might not be detected anymore. The system then changes its state to "unplugged" which is leading to traffic impact and at least a partial DoS. Once the system is less busy the port states return to their actual value. Indicators of compromise are log messages about unplugged SFPs and corresponding syspld messages without any physical or environmental cause. These can be checked by issuing the following commands:</p> <pre>user@device# show log messages   match unplugged %PFE-6: fpc0 sfp-0/1/2 SFP unplugged</pre>	<a href="https://kb.juniper.net/JS_A69890">https://kb.juniper.net/JS_A69890</a>	H-JUN-EX23-071122/2156

Allocation of Resources Without Limits or Throttling	18-Oct-2022	6.5	In VxLAN scenarios on EX4300-MP, EX4600, QFX5000 Series devices an Uncontrolled Memory Allocation vulnerability in the Packet Forwarding Engine (PFE) of Juniper Networks Junos OS allows an unauthenticated adjacently located attacker sending specific packets to cause a Denial of Service (DoS) condition by crashing one or more PFE's when they are received and processed by the device. Upon automatic restart of the PFE, continued processing of these packets will cause the memory leak to reappear. Depending on the volume of packets received the attacker may be able to create a sustained Denial of Service (DoS) condition. This issue affects: Juniper Networks Junos OS on EX4300-MP, EX4600, QFX5000 Series: 17.1 version 17.1R1 and later versions prior to 17.3R3-S12; 17.4 versions prior to 17.4R2-S13, 17.4R3-S5; 18.1 versions prior to 18.1R3-S13; 18.2 versions prior to 18.2R3-S8; 18.3 versions prior to 18.3R3-S5; 18.4 versions prior to 18.4R1-S8,	<a href="https://kb.juniper.net/JS_A69876">https://kb.juniper.net/JS_A69876</a> , <a href="https://www.juniper.net/documentation/us/en/software/junos/ovsdb-vxlan/evpn-vxlan/topics/ref/statement/vxlan.html#id-vxlan_d281e31">https://www.juniper.net/documentation/us/en/software/junos/ovsdb-vxlan/evpn-vxlan/topics/ref/statement/vxlan.html#id-vxlan_d281e31</a>	H-JUN-EX43-071122/2162

Access of Uninitialized Pointer	18-Oct-2022	7.5	An Access of Uninitialized Pointer vulnerability in SIP Application Layer Gateway (ALG) of Juniper Networks Junos OS on SRX Series and MX Series allows an unauthenticated, network-based attacker to cause a Denial of Service (DoS). When specific valid SIP packets are received the PFE will crash and restart. This issue affects Juniper Networks Junos OS on SRX Series and MX Series: 20.4 versions prior to 20.4R3-S4; 21.1 versions prior to 21.1R3-S2; 21.2 versions prior to 21.2R3-S2; 21.3 versions prior to 21.3R2-S2, 21.3R3; 21.4 versions prior to 21.4R1-S2, 21.4R2; 22.1 versions prior to 22.1R1-S1, 22.1R2. This issue does not affect Juniper Networks Junos OS versions prior to 20.4R1. <b>CVE ID : CVE-2022-22236</b>	<a href="https://kb.juniper.net/JS_A69892">https://kb.juniper.net/JS_A69892</a>	H-JUN-MX80-071122/2218

<b>Product: ptx10004</b>					
Affected Version(s): -					
Improper Input Validation	18-Oct-2022	7.5	<p>An Improper Validation of Syntactic Correctness of Input vulnerability in the kernel of Juniper Networks Junos OS Evolved on PTX series allows a network-based, unauthenticated attacker to cause a Denial of Service (DoS). When an incoming TCP packet destined to the device is malformed there is a possibility of a kernel panic. Only TCP packets destined to the ports for BGP, LDP and MSDP can trigger this. This issue only affects PTX10004, PTX10008, PTX10016. No other PTX Series devices or other platforms are affected. This issue affects Juniper Networks Junos OS Evolved: 20.4-EVO versions prior to 20.4R3-S4-EVO; 21.3-EVO versions prior to 21.3R3-EVO; 21.4-EVO versions prior to 21.4R3-EVO; 22.1-EVO versions prior to 22.1R2-EVO. This issue does not affect Juniper Networks Junos OS Evolved versions prior to 20.4R1-EVO.</p>	<a href="https://kb.juniper.net/JS_A69915">https://kb.juniper.net/JS_A69915</a>	H-JUN-PTX1-071122/2234

Improper Check for Unusual or Exceptional Conditions	18-Oct-2022	7.5	An Improper Check for Unusual or Exceptional Conditions vulnerability in the Packet Forwarding Engine (PFE) of Juniper Networks Junos OS on SRX Series allows an unauthenticated, network-based, attacker to cause Denial of Service (DoS). A PFE crash will happen when a GPRS Tunnel Protocol (GTP) packet is received with a malformed field in the IP header of GTP encapsulated General Packet Radio Services (GPRS) traffic. The packet needs to match existing state which is outside the attackers control, so the issue cannot be directly exploited. The issue will only be observed when endpoint address validation is enabled. This issue affects Juniper Networks Junos OS on SRX Series: 20.2 versions prior to 20.2R3-S5; 20.3 versions prior to 20.3R3-S4; 20.4 versions prior to 20.4R3-S3; 21.1 versions prior to 21.1R3-S2; 21.2 versions prior to 21.2R3-S1; 21.3 versions prior to 21.3R3; 21.4 versions prior to 21.4R1-S2, 21.4R2; 22.1 versions prior to 22.1R1-S1, 22.1R2. This issue does not affect Juniper	<a href="https://kb.juniper.net/JS_A69891">https://kb.juniper.net/JS_A69891</a>	H-JUN-SRX5-071122/2375
